TDD demonstration journal — instructor/student worksheet

Do **not** claim a red–green history simply because sample code is already present. In an isolated branch, remove or rename only the **practice** implementation `web/src/lib/checkout.js` (not the real storefront), then follow:

1. Write a failing test for logged-out checkout, commit `test: describe checkout auth restriction`.
2. Run `npx vitest run tests/unit/mocks.test.js`; paste the exact RED failure below.
3. Implement smallest working `checkout` in the practice module, commit `chore: implement checkout exercise`.
4. Run again; paste GREEN output.
5. Refactor code without changing behaviour; rerun and record output.

RED: (student adds terminal output)

GREEN: (student adds terminal output)

Refactor:

Notes about the difference between a simulated failure and a real defect:
